

Assignment 1: ABCs of Digital Certificates

Individual Assignment

PART-A: Comparison of Digital Certificates in the chain of trust of a website

- Visit the website **#N** in [this list of top-100 most visited websites globally](#) where **#N** is the last two digits in your roll number and download all the certificates in .CER format in the chain of trust from the root Certificate, intermediate certificate(s), to the end-user (website) certificate at the leaf in the hierarchy.
- Compare the digital certificates in the chain in terms of various field values by filling this table.

Field Name	Subject (CN) of certificate holder (website)	Subject (CN) of certificate holder (intermediate)	Subject (CN) of certificate holder (intermediate, if applicable)	Subject (CN) of certificate holder (root)	Remarks/observations
Issuer					
Version No.					
Signature Algo					
Size of digest					
Signature Value					
Validity period					
Is Subject field (CN), FQDN?					
Certificate type: DV, IV, OV or EV? Tell also how you are able to					

determine the type!					
Subject Alternative Name (SAN/UCC), if any					
Certificate category: Single domain, wildcard o Multi-domain SAN/UCC cert?					
Public Key Info like key algo, key length, public exponent (e) in case of RSA					
Public key or modulus (n) in case of RSA					
Key usages; how do they vary in the chain?					
Basic constraints, how do they vary in the chain?					
Name constraints (if any), how are these useful?					
Size of the certificate					

Any other parameters that you found interesting?					
--	--	--	--	--	--

Answer the following queries after filling out the above table:

1. Which certificate type (DV/OV/IV/EV) is more trustable and expensive?
2. What is the role of Subject Alternative Name (SAN) field in X.509 certificate?
3. Why are key usages and basic constraints different for root, intermediate and end certificates?
4. What is the difference between Signature value and Thumbprint of a digital certificate?
5. Why do RSA key lengths increase over the years? Why is ECDSA being preferred over RSA now-a-days?
6. What are pros and cons of pre-loading root and intermediate certificates in the root stores of browsers and OSes?
7. Why are root CAs kept offline?
8. List out names of OS/Browser/Company whose root stores pre-populated with Root and Intermediate CA certificates of the website #N?

PART-B

1. You have received the digital certificate of the website #N over email. How do you verify whether the certificate is valid without using any online tools or browsers? Write a psuedo-code of your verifier function named myCertChecker() and explain how it works by picking the entire chain of trust of an end-user cert (of the website #N) in PART-A of this assignment.
2. Consider the scenario in which evil Trudy has used the digital certificate of the website (Bob) named abc.com to launch her own web server with the domain name, xyz.com. Does your function myCertChecker() returns valid or invalid for this when someone like Alice tries to access Trudy's website xyz.com from a browser like Chrome/Edge/Firefox?
3. Consider the scenario in which evil Trudy has used the digital certificate of Bob's website abc.com to launch her own web server with the domain name, xyz.com. When a web client (Alice) tries to connect with Bob's website abc.com by sending a DNS query, Trudy responds with her IP address by launching MITM attack ([What is DNS cache poisoning? | DNS spoofing | Cloudflare](#)) Does your function myCertChecker() returns valid or invalid for this and what are the consequences? What kind of attacks can Trudy launch in this scenario?

Deliverables in GC:

- Certificates used for completing this assignment and a readable PDF Report with name "DCAsg-<RollNo>.PDF" compressed and encrypted with AES-256 using open source 7-zip file archiver tool with your RollNo (UPPERCASE) as the password.
 - In your report, also briefly explain how 7-zip uses the password to encrypt compressed files using secure hash and symmetric algorithms. What role does the password length play in brute force attacks to decrypt the encrypted files?
